## Tiger Conservation of Ecosystem...

Tigers spans large parts of Asia, although it has greatly reduced in the last 50 years. Tigers are still found in a wide variety of forests, including dry deciduous, moist deciduous, evergreen, & mangrove.

Tiger, being at the apex of the food chain, can be considered as the indicator of the stability of the ecosystem. For a viable tiger population, a habitat should possess a good prey base, which in turn will depend on undisturbed forest vegetation. Thus, 'Project Tiger' is basically the conservation of the entire ecosystem & apart from tigers, all other wild animals also have increased in number in the project areas.

The tiger is a very important member of the ecosystem that it inhabits. It shares a symbiotic relation with the jungles that harbour it. The tiger needs a minimum density of herbivorous ungulates to sustain it. Herbivorous in turn need vegetation to sustain their population. There is a large area of forest, & hence foliage, available. This means that

## TIGER AND CONSERVATION OF ECOSYSTEM.

Tiger is symbol of wilderness and well-being of the ecosystem. By conserving and saving tigers and entire wilderness ecosystem is conserved. In nature, barring human beings and their domesticates, rest of the ecosystem is wild. Hence conserving wilderness is important and crucial to maintain the life support system. So saving tiger amounts to saving the ecosystem which is crucial for man's own survival.

Tigers play a pivotal role in the health of the ecosystem. Tigers constitute the top carnivores in the ecosystem and is at the apex of the food chain. The removal of top carnivore from an ecosystem can have a significant impact on the relative abundance of other species within a guild. Along with other carnivores as leopard it acts as a control mechanism for herbivores or consumers.
