Pauropsylla depressa induced galls in ficus plant- Basic Biochemical and Antimicrobial study

Introduction:

In Ficus racemosa, (gular) plants (family: Moraceae) Galls were induced by wasp, a Hemipteran insect Pauropsylla depressa (Psyllidae). Galls are the outgrowth of the plant tissues that provide nourishment, protection and shelter to the insect.

Material and methods:

Morphological studies were conducted in the collected leaves and mascrated using aqueous methanol and extract were used for biochemical and antimicrobial study.

Conclusion:
P. depressa induced gall leaves shows presence of carbohydrate, higher sugar & amino acid content.

Significant antibacterial activity is observed against gram negative stains(E.coli) with aqueous methanolic extract of galled tissues.

Result:

Average gall size: 0.1-0.7cm
Colour- green, yellow, red
